

RaySAMi – Release Notes (10.2.3)

21.10.2024

Inhalt

- 1. Changes**3
- 2. Further Changes**3
- 3. Release Notes**3
 - 3.1 Keycloak Configuration Migration3
 - 3.2 New Cron Job „usermanagement_sync“3
 - 3.3 New Cron Job „usermanagement_sync“3
- 4. Interface Changes**3
- 5. Interface Deprecations**4

1. Changes

Advanced Dashboards: SAM For Clients & Datacenter hosted customers now have access to an integrated analytics solution offering advanced dashboard and chart capabilities.

2. Further Changes

- Negative values such as cost reimbursements can now also be saved in the cloud billing data (provider expenditures)
- Small UI adjustments that improve look and feel as well as accessibility of the application

3. Release Notes

3.1 Keycloak Configuration Migration

To streamline setup automation, the configuration for Keycloak has been moved from the application's system configuration (via UI) to the config.ini file. This change simplifies automated deployments and configuration management. Existing customers currently using Keycloak need to manually transfer their configurations from the system configuration to the config.ini file. Please refer to the system administration manual for details on the new config.ini directives to ensure a smooth transition.

3.2 New Cron Job „usermanagement_sync“

The new cron job synchronizes users, roles, and role assignments between the application and USU User Management, based on the users' email addresses. Users without an email address are excluded from the synchronization. The cron job is disabled by default and requires the USU User Management module to be available.

3.3 New Cron Job „usermanagement_sync“

The new cron job synchronizes data with Superset, including the database connection, datasets, dashboards, roles, permissions, rules, and users. The cron job is disabled by default and requires the Advanced Dashboards module to be available.

4. Interface Changes

None

5. Interface Deprecations

None
